

XPi 10esp

HD Radio™ Embedded Exporter

Versatility for HD Radio™

- Embedded design improves reliability
- Diversity Delay can be automatically selected or set to user's preference.
- GUI allows viewing from Windows, Linux, or MAC
- Internal GPS receiver for synchronization of system
- External 10MHz and 1PPS inputs for external GPS operation

The XPi 10esp embedded exporter offers the latest in the development of HD Radio™, increasing overall reliability and functionality for stations broadcasting HD.

The XPi 10esp is BE's 3rd generation exporter. With its embedded design, the XPi 10esp eliminates PC-based equipment at the transmitter site for increased reliability as well as a reduction in cost for implementing and maintaining HD Radio. By removing the Linux operating system, boot times are improved and memory leaks are eliminated.

The XPi 10esp provides the HD broadcaster the unique ability to choose the XPi 10's Automatic Diversity Delay or their own user setting. With Automatic Diversity Delay, the XPi 10esp continually monitors the FM analog and HD signals and provides automatic time alignment with no adjustments necessary.

The XPi 10esp acts as a central hub, combining the advantages of HD into a single HD coded Ethernet stream to produce the main HD channel, multiple program services and Messagecasting data to the listener.

The XPi 10esp from BE gives you the operational flexibility required for today's radio. The XPi 10esp provides you with one more tool to deliver the best radio to your listeners while easing overall operation of your station!
